1 INTRODUCTION

NOTE:

- 1. MESA/PUMA2015 END-USERS CANNOT USE THIS GUIDE. MESA/PUMA2015 USER PLEASE CONTACT EUMETSAT HELPDESK ops@eumetsat.int**
- 2. THIS MIGRATION USER GUIDE IS INTENDED TO BE USED ONLY BY NON PUMA/MESA END-USERS.**

The purpose of this manual is to guide an existing user of EUMETCast Africa provided from EUTELSAT 5W through the migration to the new DVB-S2 based EUMETCast Africa service provided from EUTELSAT 8W.

The new Africa Service (AFR-1) is the continuation of the current EUMETCast Africa DVB-S service, and all users have access to the same data as on the current system. The DVB-S2 AFR-1 downlink started early May 2018 and became operational on 7 May 2018. The DVB-S operation is planned to stop end of July 2018.

The following web page contains general and most recent information, including the schedule:

https://www.eumetsat.int/website/home/TechnicalBulletins/EUMETCast/DAT_3589215.html

The migration involves several activities:

- Preparations and status check
- Update of Tellicast
- Replacement of DVB-S receiver or card with a DVB-S2 device
- Repointing of the reception antenna from EUTELSAT 5W to EUTELSAT 8W
- Update of DVB receiver configuration

It is recommended to perform these steps in the order as shown in the following section.

2 UPGRADE STEPS

2.1 Step 1: Download Upgrade Documentation and Packages

First download all packages necessary for the migration and documentation from the following location:

ftp://ftp.eumetsat.int/pub/OPS/out/user/EUMETCast_Support/Africa_Migration

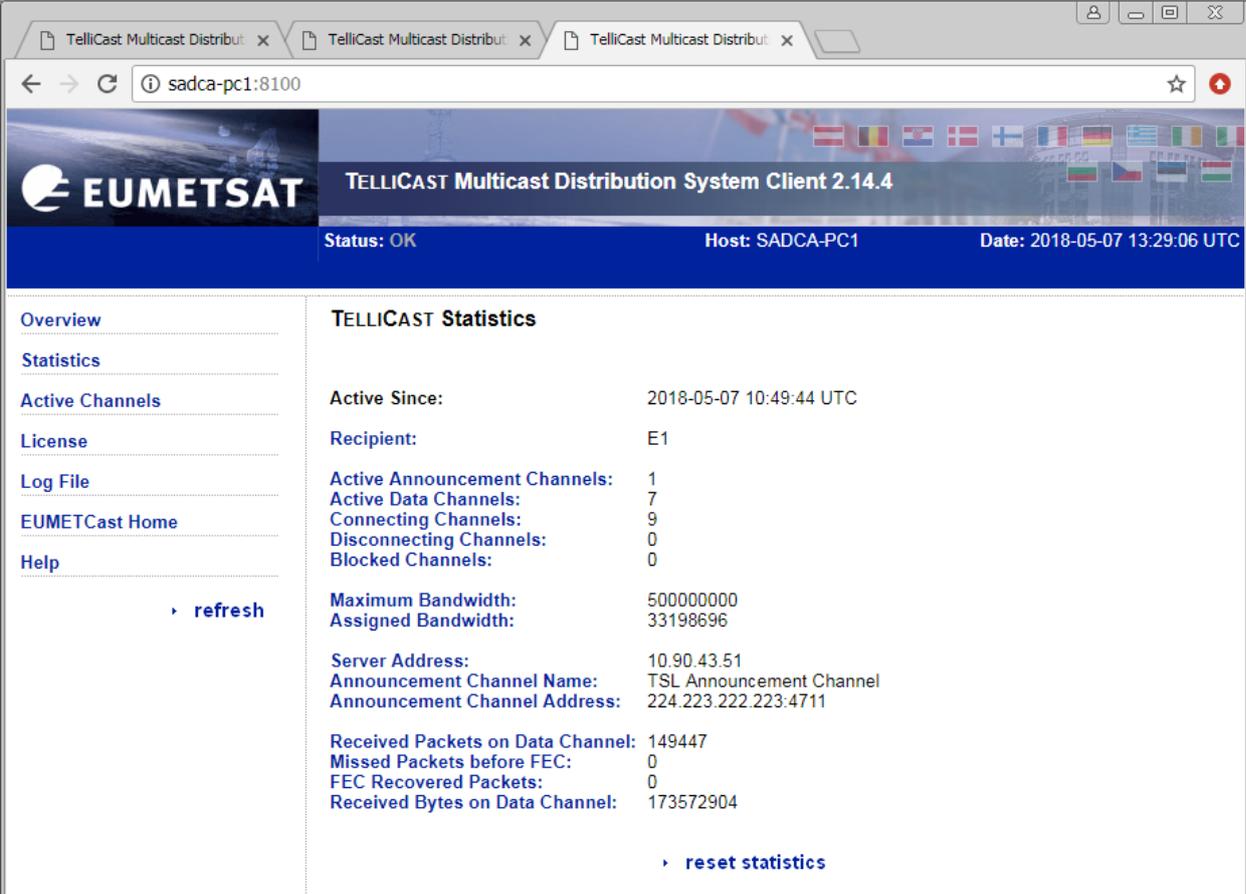

Operating system specific packages can be found in the related sub-directories. The linux files must be copied to the /root directory, please read also the Readme.txt file.

2.2 Step 2: Check the Status of the Existing DVB-S System

As a starting point, make a status check of the current system and store the results in a file, in case support by EUMETSAT is needed.

Windows and Linux

Is reception working	Yes/No
Quality of reception	Open the Tellicast “Statistics” page (see Figure 1), reset the counter and make a screenshot 1 hour later
Tellicast version and client information	Open the Tellicast “License” page (see Figure 2), and make a screenshot
Store log files	Save Tellicast logs (recv...log, recv...log.1, etc.) in a temporary folder, for later analysis if needed.
If used: DVB router status, Novra Ayecka SR1	Make screenshots of reception status, see user guides.

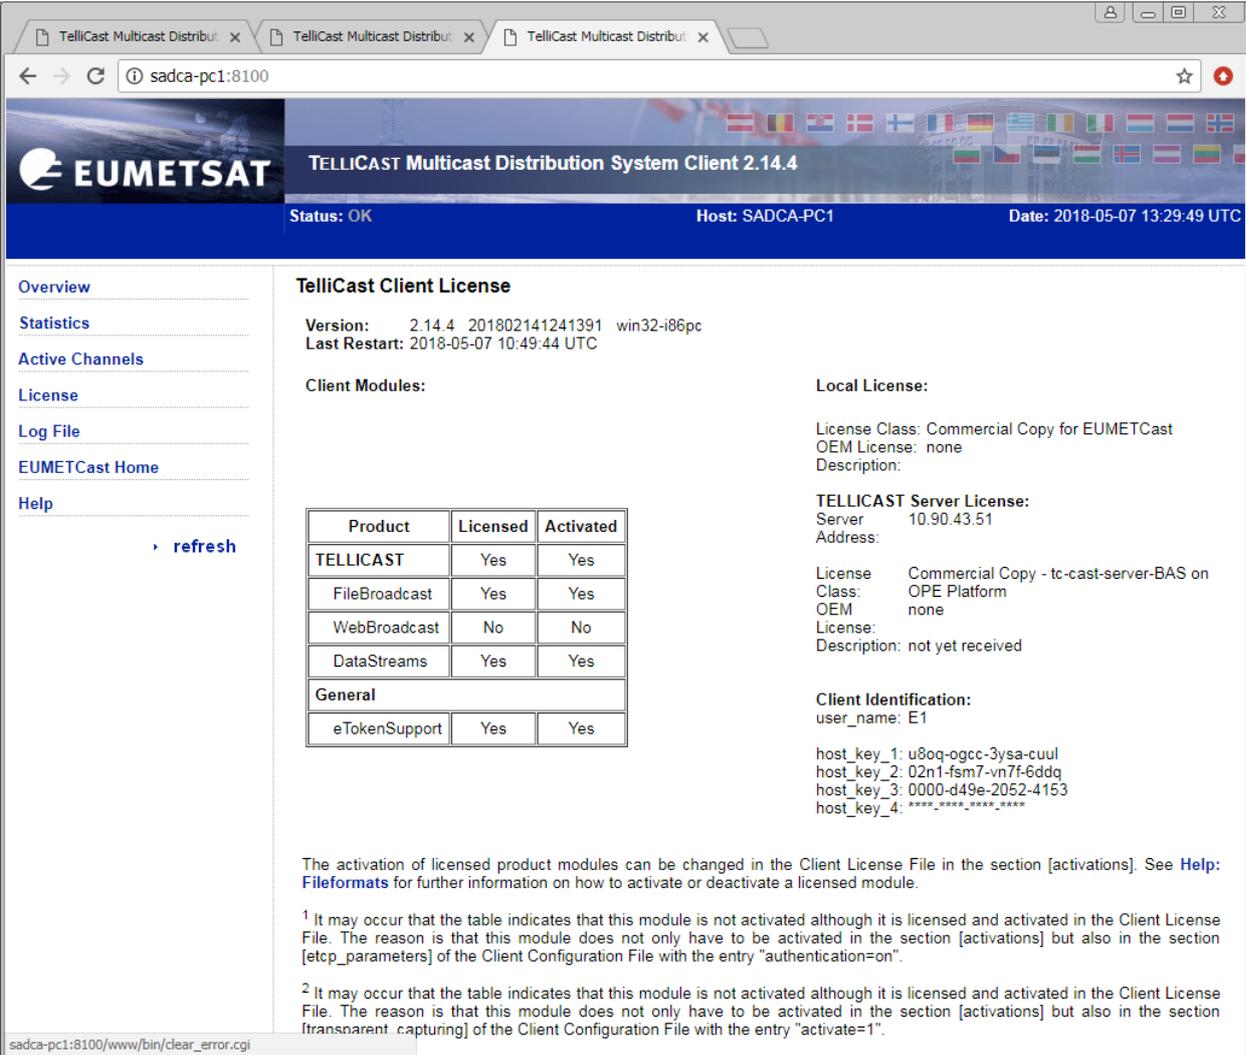

The screenshot shows the Tellicast Multicast Distribution System Client 2.14.4 interface. The browser address bar shows 'sadca-pc1:8100'. The page header includes the EUMETSAT logo and the title 'TELLICAST Multicast Distribution System Client 2.14.4'. The status bar indicates 'Status: OK', 'Host: SADCA-PC1', and 'Date: 2018-05-07 13:29:06 UTC'. The main content area is divided into a left sidebar with navigation links (Overview, Statistics, Active Channels, License, Log File, EUMETCast Home, Help) and a main panel titled 'TELLICAST Statistics'. The statistics panel shows the following data:

Active Since:	2018-05-07 10:49:44 UTC
Recipient:	E1
Active Announcement Channels:	1
Active Data Channels:	7
Connecting Channels:	9
Disconnecting Channels:	0
Blocked Channels:	0
Maximum Bandwidth:	500000000
Assigned Bandwidth:	33198696
Server Address:	10.90.43.51
Announcement Channel Name:	TSL Announcement Channel
Announcement Channel Address:	224.223.222.223:4711
Received Packets on Data Channel:	149447
Missed Packets before FEC:	0
FEC Recovered Packets:	0
Received Bytes on Data Channel:	173572904

At the bottom of the statistics panel, there is a 'refresh' button and a 'reset statistics' button.

Figure 1: Tellicast Statistics page

The screenshot shows the TELLICAST Multicast Distribution System Client 2.14.4 interface. The status is OK, host is SADCA-PC1, and the date is 2018-05-07 13:29:49 UTC. The interface includes a navigation menu on the left with options like Overview, Statistics, Active Channels, License, Log File, EUMETCast Home, and Help. The main content area displays the TELLICAST Client License information, including version, last restart, and client modules. A table lists product modules with their license and activation status. The table is as follows:

Product	Licensed	Activated
TELLICAST	Yes	Yes
FileBroadcast	Yes	Yes
WebBroadcast	No	No
DataStreams	Yes	Yes
General		
eTokenSupport	Yes	Yes

Additional license details include Local License (Commercial Copy for EUMETCast), TELLICAST Server License (Server 10.90.43.51), and Client Identification (user_name: E1, host_key_1: u8oq-ogcc-3ysa-cuul, host_key_2: 02n1-fsm7-vn7f-6ddq, host_key_3: 0000-d49e-2052-4153, host_key_4: ****-****-****-****).

The activation of licensed product modules can be changed in the Client License File in the section [activations]. See [Help: Fileformats](#) for further information on how to activate or deactivate a licensed module.

¹ It may occur that the table indicates that this module is not activated although it is licensed and activated in the Client License File. The reason is that this module does not only have to be activated in the section [activations] but also in the section [etcp_parameters] of the Client Configuration File with the entry "authentication=on".

² It may occur that the table indicates that this module is not activated although it is licensed and activated in the Client License File. The reason is that this module does not only have to be activated in the section [activations] but also in the section [transparent_capturing] of the Client Configuration File with the entry "activate=1".

Figure 2: Tellicast Client Identification page

Windows

Reception quality of internal DVB cards, or USB receivers	Make a screenshot of DVB reception quality, SNR, Signal status (e.g. BDADDataEx "Status/Tuner" see Figure 3, or same images from other applications, or the DVB router)
---	---

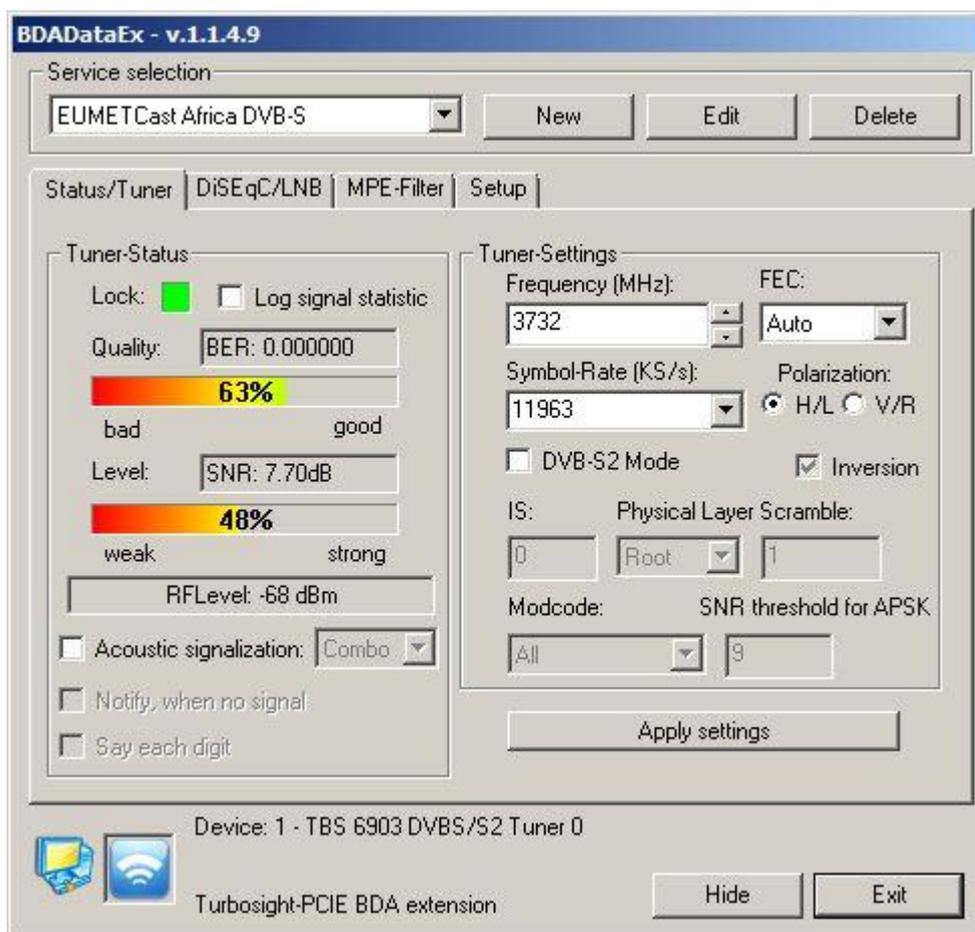

Figure 3: DVB card reception status

Linux

Reception quality of internal DVB cards or USB receivers	Open terminal window and type: femon -H store the output in a file or make a screenshot
--	---

DVB Routers

Reception quality of external DVB routers	Make screenshot from Novra DVB interface or Ayecka SR telnet interface
---	--

2.3 Step 3: Update Tellicast

The new Service has new Tellicast announcement and data channels. However the same data files are transmitted using an equivalent set of channels (see Appendix A).

The Tellicast configuration files must therefore be updated. This is done differently for Windows and Linux.

Windows

Download all files from

ftp://ftp.eumetsat.int/pub/OPS/out/user/EUMETCast_Support/Africa_Migration/Windows/

1. You must have administrator privileges to install the new version.
2. Start eumetsat-setup-2.14.4_7.msi
3. If a recent version of Tellicast was installed, the username and password are prefilled, and you can continue with the upgrade of the installed version.
 - a. Select “Keep currently installed channel configuration files...”.
 - b. Accept all further windows until the client is upgraded.
 - c. Now the old service is unchanged and a new AFR-1 service is added.
 - d. The new AFR-1 service can be started in parallel to the old service, however no data will be received until the antenna is repointed and the DVB receiver configured.
4. If an older version of Tellicast was installed (T-Systems, BusinessTV-IP), a complete new installation will be made, which can run in parallel to the installed version.
 - a. Follow the installation guide “Tellicast_V2.14+_windows_installation.pdf”.
 - b. The 2.14 version will be running in parallel to the older version.
 - c. Change the data processing software to point to the new target directories of the new client under \EUMETCast\received.
 - d. Uninstall the old “T-Systems, BusinessTV-IP” client.

Then start the BAS service and open the Tellicast shell from the icon in the tray.

The new AFR-1 service can also be started but it will not yet receive any data.

Both services can be left running.

Linux

Download all files from

ftp://ftp.eumetsat.int/pub/OPS/out/user/EUMETCast_Support/Africa_Migration/Linux

1. You must be logged in as root and all downloaded files must be copied to /root.
2. Extract the scripts by running “tar -zxvf scripts_v2.tar.gz” (or higher version, v3...)
3. Execute the script “upgrade-tellicast-afr.sh” and follow instructions.

A backup of the old client software and configuration will be made.

The Tellicast client will be upgraded to 2.14.4.

A new service AFR-1 will be added.

4. Check if reception of old Africa service is still working. Open a browser and enter
<http://127.0.0.1:8100> for the old service
<http://127.0.0.1:8300> for the new service

Both services can be left running.

5. In case of problems you can restore the old configuration by running:

```
./restore-tellicast-afr.sh
```

Then send the following files to EUMETSAT helpdesk.

```
backup-tellicast-afr.tar.gz
```

```
log-upgrade-afr.log
```

6. Restart (reboot) the computer.

2.4 Step 4: Upgrade of DVB Hardware and Software

The following table described DVB-S2 devices where EUMETCast Guides already exist:

COMPANY NAME	MODEL	TYPE	EUMETCAST SERVICE SUPPORT	OS SUPPORT	FURTHER INFO BY COMPANY	EUMETCAST SETUP INFO	USED BY EUM
Ayecka	Ayecka SR1	Router LAN	EUMETCast Europe Africa Services) (All	All	Ayecka SR1 Satellite Receiver	SR1 Setup Guide (v4A)	Yes
Newtec	MDM6000	Router LAN	EUMETCast Europe Africa Services)a (All	All	Newtec MDM6000 Satellite Modem	MDM6000 Setup Guide (v1F)	Yes
Novra	Novra S300E or S300N	Router LAN	EUMETCast Europe Africa Services) (All	All	Novra S300E Satellite Receiver	S300 Setup Guide (v2D)	Yes
Omicom	Pro Omicom 16/32 PSK	PCI Card	EUMETCast Europe Africa Services) (All	Windows, Linux	Omicom Pro 16/32 APSK PCI	Omicom Windows Setup Guide (v1C) For Linux Guide contact Email	Yes
TBS	TBS 6903 or TBS 6908	PCIe	EUMETCast Europe Africa Services) (All	Windows, Linux	TBS-6903 Professional DVB-S2 Dual Tuner Card TBS-6908 Professional DVB-S2 Quad Tuner Card	TBS-6903/6908 Windows Setup Guide (v2) TBS DVB-S2 Receivers EUMETCast LINUX Setup Guide (v2)	Yes
TBS	TBS 5925	USB	EUMETCast Europe Africa Services) (All	Windows, Linux	TBS-5925 Satellite Receiver	TBS-5925 Windows Setup Guide (v1F) TBS DVB-S2 Receivers EUMETCast LINUX Setup Guide (v2)	Yes
TBS	TBS 5927	USB	EUMETCast Europe Africa Services) (All	Windows, Linux	TBS-5927 Satellite Receiver	TBS-5927 Windows Setup Guide (v1) Linux Guide will be available soon	Yes

Table 1: EUMETCast Africa compliant DVB-S2 devices

If the current device supports only DVB-S, it must be replaced by a DVB-S2 device. Please check on the local market if one of the devices in Table 1 is available.

If you have a model not listed in Table 1, please contact EUMETSAT helpdesk. If this model works under DVB-S, it should also work under DVB-S2.

New DVB-S2 devices under Windows

Follow the EUMETSAT guides and manufacturer installation instructions to operate the new DVB-S2 device on the old Africa service before starting the repointing.

DVB Cards and USB Devices under Linux

Making internal DVB-S2 cards and USB devices work under Linux requires some additional work after the DVB kernel drivers have been installed. The `dvb-eumetcast` service, which manages the tuning of the DVB devices and which makes the data available on the `dummy0` network interface, must be upgraded to include the new Africa service. This should be done already on the old Africa service in order to verify its function.

1. Execute script:

```
./upgrade-dvb-eumetcast-afr.sh
```

and follow instructions, if any.

2. Check if reception of old Africa service is still working.
3. In case of problems you can restore the old configuration by starting:

```
./restore-dvb-eumetcast-afr.sh
```

Then send the following files to EUMETSAT helpdesk.

```
backup-dvb-eumetcast-afr.tar.gz
```

```
log-upgrade-afr.log
```

Possible problems could be that a non-standard LNB is used, e.g. the LOF (oscillator frequency) is not 5150 MHz. Some LNBs have an LOF of 5750 MHz, and this must be changed in the tuning parameters in the file `/etc/dvb-eumetcast.cfg`. Please contact EUMETSAT helpdesk in this case and always send the backup and log files, from where we can derive the original settings.

2.5 Step 5: Antenna Repointing

Please make sure that all previous steps have been successfully completed.

The assumption is that you have good reception with the current antenna. The reception quality (SNR, EsNo, C/N, etc) should be the same on the new service with sufficient margin. Due to the different downlink frequency it is possible that interference from other sources (radar, WIFI, mobile services, ...) is lower or even higher. For most of the users there should be no change.

The new Satellite parameters are the following (Table 2):

PARAMETER	VALUE
Name	EUTELSAT 8WB
Transponder	04C
Down Link Frequency	3848,2525 MHz
Symbol Rate	9892 kS/s
Polarisation	Left hand circular
Roll-Off	5%
Transmission Standard	DVB-S2
MODCOD	QPSK3/4
C-Band Transponder EUTELSAT 8WB	

Table 2: New Satellite parameters

2.5.1 Step 5.1: Mark the Current Antenna Azimuth and Elevation Positions

The repointing instructions start from a perfect pointing to the current satellite EUTELSAT 5W. It is important to mark the current position to come back to the old alignment easily, in case you don't find the new satellite.

The following pictures (Figures 4 and 5) show examples of marking the current azimuth/elevation position with black permanent markers:

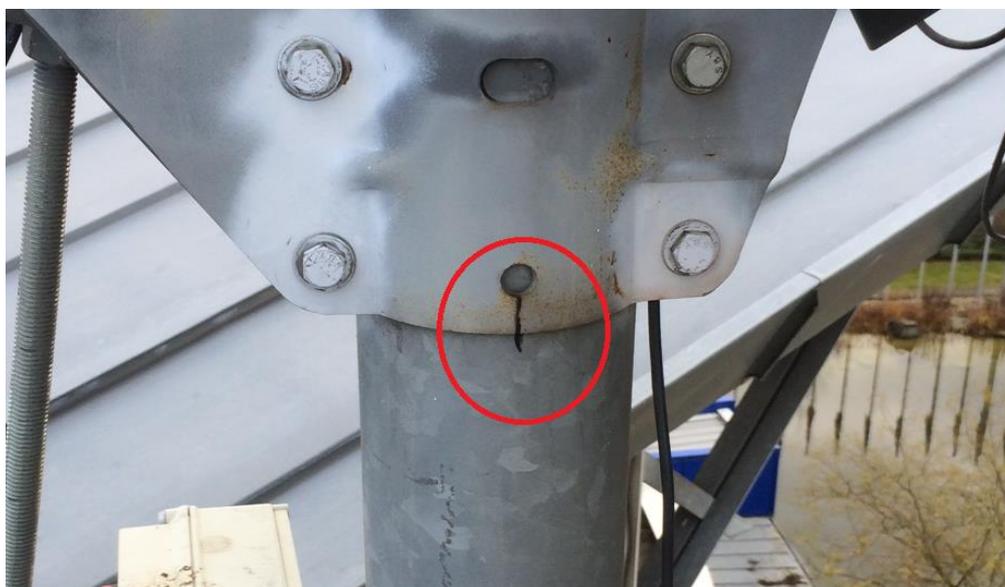

Figure 4: Azimuth Mark

Figure 5: Elevation Mark

2.5.2 Step 5.1: Start Azimuth and Elevation Adjustment

The following tables (Table 3 and 4) show the changes in azimuth and elevation necessary for a set of locations.

The values are derived from <http://www.dishpointer.com/>.

The highlighted locations (in yellow) show a rapid change in azimuth depending on the location. Therefore in this region a detailed calculation for the accurate location should be made (from <http://www.dishpointer.com/>).

location		5W EUT 5 W		8W EUT 8 W					
Latitude	Longitude	Elev	Azim	Elev	Azim	elevation change		azimuth change	
deg	deg	deg	deg	deg	deg	deg		deg	
30	-10	54.6	170.1	55	176	0.4	up	5.9	right west

-20	50	24.7	283.5	21.8	282.1	-2.9	down	-1.4	left west
-20	60	15	279.1	12.1	277.9	-2.9	down	-1.2	left west

Table 4: Antenna pointing changes for various locations in the southern hemisphere

If you are not familiar with antenna pointing, please call a professional or satellite dish installer.

If you can do it yourself, have following tools ready:

- DVB signal analyser or satfinder, to find the new satellite, and perform the course pointing.
- Your DVB-S2 device for the fine pointing.
- An inclinometer to measure the elevation change.
- A compass to measure the azimuth change.

Due to the size and weight of the antenna use proper protection and scaffolding to reach the adjustment bolts and nuts.

1. Connect the DVB analyser to the LNB and check to identify the current satellite. If the DVB-S2 device is used, confirm good signal before you start on the old downlink frequency 3732 MHz, or 1418 MHz on the SR1 (2018 MHz if LOF = 5750)
2. First adjust the elevation, by going down (or up) in the direction indicated in the table, use the inclinometer, and adjust only to 80% of the proposed elevation change value.

2.5.3 Step 5.3: Tuning to new service and fine pointing

1. Set the new downlink frequency 3848,2525 MHz, on the Ayecka SR1 set 1302 MHz (1902 MHz if LOF = 5750).

On a Windows DVB-S2 card set the new reception parameters, frequency and symbol rate according to Figure 6. It may be possible that reception is already starting.

On DVB routers set the new frequency and DVB-S2 mode, leave symbolrate automatic if possible.

On Linux internal DVB cards or USB devices, tune to the new frequency by typing from the command line as root:

```
./tune_to_new_E8W.sh
```

then run

```
femon -H
```

to show continuous reading of the dvb reception

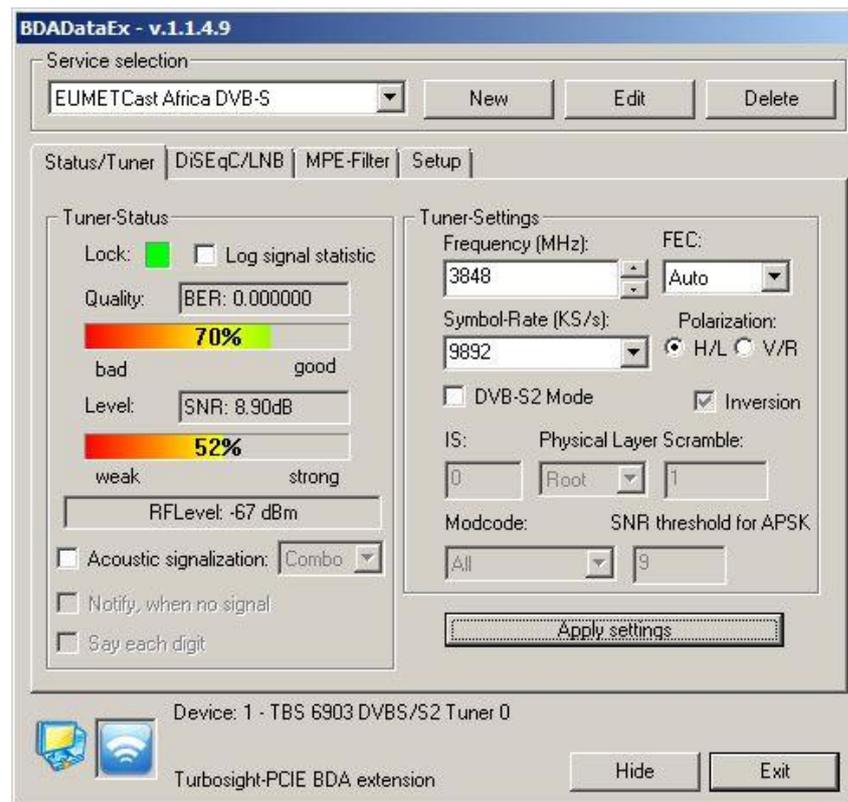

Figure 6: New Africa reception parameters

2. Then untighten the azimuth bolts, but just enough that the antenna can be moved in azimuth. Hold a compass to the antenna at any non-metallic part, far away from iron and steel. Then slowly turn the antenna in azimuth towards west, millimetre by millimetre. At approximately half of the required distance reception should already start.
3. Then connect the normal DVB-S2 receiver through the normal cable and try to optimise the SNR, or quality or C/N or link margin, depending what value is available. Communication between the observer at the receiver and outdoor people can be done via mobile phone.
4. Take time to find the optimum reception values.
5. Then slowly tighten the nuts and bolts, and observe the reception status. Just tightening might change the pointing again.

2.6 Step 6: Verify correct Tellicast reception

Is reception working	Yes/No
Quality of reception http://127.0.0.1:8300	Open the Tellicast “Statistics” page (see Figure 1), reset the counter and make a screenshot 1 hour later
Tellicast version and client information http://127.0.0.1:8300	Open the Tellicast “License” page (see Figure 2), and make a screenshot
Store log files	Save Tellicast logs (recv...log, recv...log.1, etc.) in a temporary folder, for later analysis if needed.
If used: DVB router status, Novra Ayecka SR1	Make screenshots of reception status, see user guides.

Windows

Reception quality of internal DVB cards, or USB receivers	Make a screenshot of DVB reception quality, SNR, Signal status (e.g. BDADataEx “Status/Tuner” see Figure 3, or same images from other applications, or the DVB router)
---	--

Linux

Reception quality of internal DVB cards or USB receivers	Open terminal window and type: femon -H store the output in a file or make a screenshot
--	---

3 ACRONYMS

DVB-S, DVB-S2	Digital Video Broadcast, a broadcast standard
EUMETCast	EUMETSAT multicast based broadcast system
EUMETSAT	European Meteorological Satellite Organisation
LNB	low-noise block downconverter
PID	Packet IDentification
CCM	Constant Coding and Modulation

APPENDIX A NEW VERSUS OLD CHANNEL LISTING
